1.The probability that it is Friday and that a student is absent is 3 %. Since there are 5 school days in a week, the probability that it is Friday is 20 %. What is the probability that a student is absent given that today is Friday? Apply Baye's rule in python to get the result. (Ans: 15%)

```
      #Probability that it is Friday and that a student is absent =
0.03
```

->FandA= 0.03

```
#Probability it is Friday = 0.2
```
->F=0.2

```
# We need to find the probability that a student is absent given that
today is Friday.

# So, We will use Conditional Probability
```

->print("student is absent|today is Friday=",FandA/F)
```
#print(FandA/F)
```

Output:

student is absent|today is Friday= 0.15

2. Extract the data from database using python
